

1837 - No. 2A - Middle & West Florida - Aug. 6-7

This storm apparently struck north of Miami on July 30, and crossed into the Gulf, where it was likely the storm that struck St. Marks on Aug. 7. The tide was 6 feet above normal at the lighthouse and St. Marks itself was covered by two feet of water (Barnes 1998).

This mysterious storm was felt in the Gulf on Aug. 7. No reports from southern Georgia and Alabama are available. A marked storm center moved west of Pensacola and St. Marks, indicated by the wind flow of strongest gusts from the S at Pensacola and from the ESE at St. Marks.
