Figure 2.6 *Number of possible ic values for all set-class cardinalities*

$$\#\mathrm{SATV}(X) = \sum_{n=1}^{6} \left(\left| \mathrm{SATV_A}(X)_n - \mathrm{SATV_B}(X)_n \right| \right)$$

Figure 2.7 Formal definition of SATV cardinality (#SATV).

c	#SATV(*X*)
0 or 12	0
1 or 11	0
2 or 10	6
3 or 9	12
4 or 8	18
5 or 7	21
6	28

*Figure 2.8 Cardinality of SATV for all set-class cardinalities (*c*).*

$$\mathrm{SATSIM}(X, Y) = \frac{\sum_{n=1}^{6} \left(\left| \mathrm{SATV_A}(X)_n - \mathrm{SATV}_{row}(Y)_n \right| + \left| \mathrm{SATV_A}(Y)_n - \mathrm{SATV}_{row}(X)_n \right| \right)}{\sum_{n=1}^{6} \left(\left| \mathrm{SATV_A}(X)_n - \mathrm{SATV_B}(X)_n \right| + \left| \mathrm{SATV_A}(Y)_n - \mathrm{SATV_B}(Y)_n \right| \right)}$$

Where X_n and Y_n are the *n*-th entries in the SATVs of pcsets *X* and *Y* respectively and *row* is a function that decides which row of the SATV to use.

Function *row*:
If $\mathrm{SATV_A}(X_n)$ is a max-related value and $\mathrm{SATV_A}(Y_n)$ is also max-related value, then the function *row* returns row A ($\mathrm{SATV_A}(X_n)$ is compared to $\mathrm{SATV_A}(Y_n)$); otherwise, *row* returns row B ($\mathrm{SATV_A}(X_n)$ is compared to $\mathrm{SATV_B}(Y_n)$).

*Figure 2.9 Formal definition of function SATSIM(*X, Y*).*

X [012678]	<420243>	$SATV_A$:	<	-1	+2	+0	+0	-1	-0	>
		$SATV_B$:	<	+4	-4	-5	-4	+4	+3	>
Y [0369]	<004002>	$SATV_A$:	<	+0	+0	-0	+0	+0	-0	>
		$SATV_B$:	<	-3	-3	+4	-3	-3	+2	>

Step 1: Compare the vectors, creating a two-part difference vector:

$SATV_A(X) : SATV_{row}(Y)$ =	2	2	4	0	2	0	= 10
$SATV_A(Y) : SATV_{row}(X)$ =	4	2	5	0	4	0	= 15
Step 2: Add together the values in the difference vectors:							= **25**

Step 3: Add together all the numerical distances between $SATV_A$ and $SATV_B$ for each set:

$\#SATV_{A+B}(X)$ =	5	+	6	+	5	+	4	+	5	+	3	= 28
$\#SATV_{A+B}(Y)$ =	3	+	3	+	4	+	3	+	3	+	2	= 18
												= **46**

Step 4: Divide the sum from step 2 by the sum from step 3 to complete the SATSIM function:

SATSIM(*X*, *Y*) = 25/46 = **0.54**

*Figure 2.10 SATSIM(*X, Y*) comparison of [012678] and [0369].*

Key to figures in value group matrix:

v	*w*
x	
y	*z*

v = smallest SATSIM number
w = largest SATSIM number
x = smallest non-zero SATSIM number
y = average SATSIM value
z = number of distinct SATSIM values

Figure 2.15 SATSIM value group matrix

Step 1. Create a min-adjusted ic vector (MAV):

$$MAV(X)_i = ICV(X)_i - \min(c, i)$$

for all i I.

Each ic i place in the MAV of X is derived by subtracting the minimal amount of ic content in any set of cardinality X (c) from the respective ICV(X) argument.

For example, one would perform the following steps to arrive at the MAV of set class [012678]:

ICV([012678])	=	<	4	2	0	2	4	3 >
min(6, *i*)	=		0	0	0	2	0	0
MAV([012678])	=	<	4	2	0	0	4	3 >

Step 2. Divide the values in the min-adjusted vector (MAV) by the min-adjusted maximal values of any set of #X:

$$PSATV(X)_i = \frac{MAV(X)_i}{\max(c, i) - \min(c, i)}$$

for all i I.

For example, one would perform the following steps to arrive at the PSATV of set class [012678]:

MAV[012678]	=	<	4	2	0	0	4	3	>
max(6, *i*)	=		5	6	5	6	5	3	
min(6, *i*)	=		0	0	0	2	0	0	
max(6, *i*) - min(6, *i*)	=		5	6	5	4	5	3	
PSATV[012678]	=	<	4/5	2/6	0/5	0/6	4/5	3/3	>
		<	0.80	0.33	0.00	0.00	0.80	1.00	>

Figure 2.16 Demonstration of PSATV of SC 6-7 [012678].

5-z36 [01247]										7-z36 [0123568]								
ICV(5-z36)	<	2	2	2	1	2	1	>		ICV(7-z36)	<	4	4	4	3	4	2	>
min(5, *i*)		0	0	0	1	0	0			min(7, *i*)		2	2	2	3	2	1	
MAV(5-z36)	<	2	2	2	0	2	1	>	=	MAV(7-z36)	<	2	2	2	0	2	1	>

Figure 2.47 Cyclic fragmentation and ic cycle vector of SC 6-z4 [012456].

The function WEIGHT is sent an integer value n (the ICCycV value) and a real number constant (in C, real numbers are called "double"). The function returns a real number. Curly brackets are used like begin and end statements in BASIC, Pascal, and many other programming languages. The symbol "=" is used to assign the variable to the left of it the value to the right of it. The symbol "==" is used to check whether the value to left is equal to the value to right (statements which check equality or inequality return Boolean values).

```
double weight(int n, double constant)      The function is passed the
                                           ICCycV_in value and the real
                                           number weighting constant. It
                                           will return a real number.
{
    int x = 0;                             Temporary variables x and y
    int y = 0;                             are reset to 0.
    repeat
    {                                      begin a loop
        x = x + 1;                         increment x by 1
        x = x * constant;                  multiply x by the real number
                                           constant
        y = y + 1;                         increment y (this keeps track of
                                           the iterations)
    }                                      end the loop when y == n
    until (y == n);
}
return x;
```

Figure 2.48 Function WEIGHT expressed as a function in C.

```
constant = 1.2          values passed to function WEIGHT
n = 4
x = 0;
y = 0;

repeat
{
    x = x + 1;          x = 1
    x = x * constant;   x = 1 * 1.2 = 1.2
    y = y + 1;          y = 1
}
until (y == n);         y ≠ n (so we continue)

{
    x = x + 1;          x = 1.2 + 1 = 2.2
    x = x * constant;   x = 2.2 * 1.2 = 2.64
    y = y + 1;          y = 1 + 1 = 2
}
until (y == n);         y ≠ n (so we continue)

{
    x = x + 1;          x = 2.64 + 1 = 3.64
    x = x * constant;   x = 3.64 * 1.2 = 4.37
    y = y + 1;          y = 2 + 1 = 3
}
until (y == n);         y ≠ n (so we continue)

{
    x = x + 1;          x = 4.37 + 1 = 5.37
    x = x * constant;   x = 5.37 * 1.2 = 6.44
    y = y + 1;          y = 3 + 1 = 4
}
until (y == n);         y == n (so we return the value in x)

return x;                return the value 6.44
```

Where X_n and Y_n are the *n*-th entries in the CSATVs of pcsets *X* and *Y* respectively and *row* is a function that decides which row of the CSATV to use.

Function *row*:
If $\text{CSATV}_{\text{A}}(X)_n$ is a max-related value and $\text{CSATV}_{\text{A}}(Y)_n$ is also max-related value, then the function *row* returns row A ($\text{CSATV}_{\text{A}}(X)_n$ is compared to $\text{CSATV}_{\text{A}}(Y)_n$); otherwise, *row* returns row B ($\text{CSATV}_{\text{A}}(X)_n$ is compared to $\text{CSATV}_{\text{B}}(Y)_n$).

*Figure 2.55 Formal definition of function CSATSIM(*X, Y*).*

Figure 3.67 CSATVs for Stravinsky sets, separated into the two families shown in figure 3.65. (Line A of each CSATV is boldfaced.)

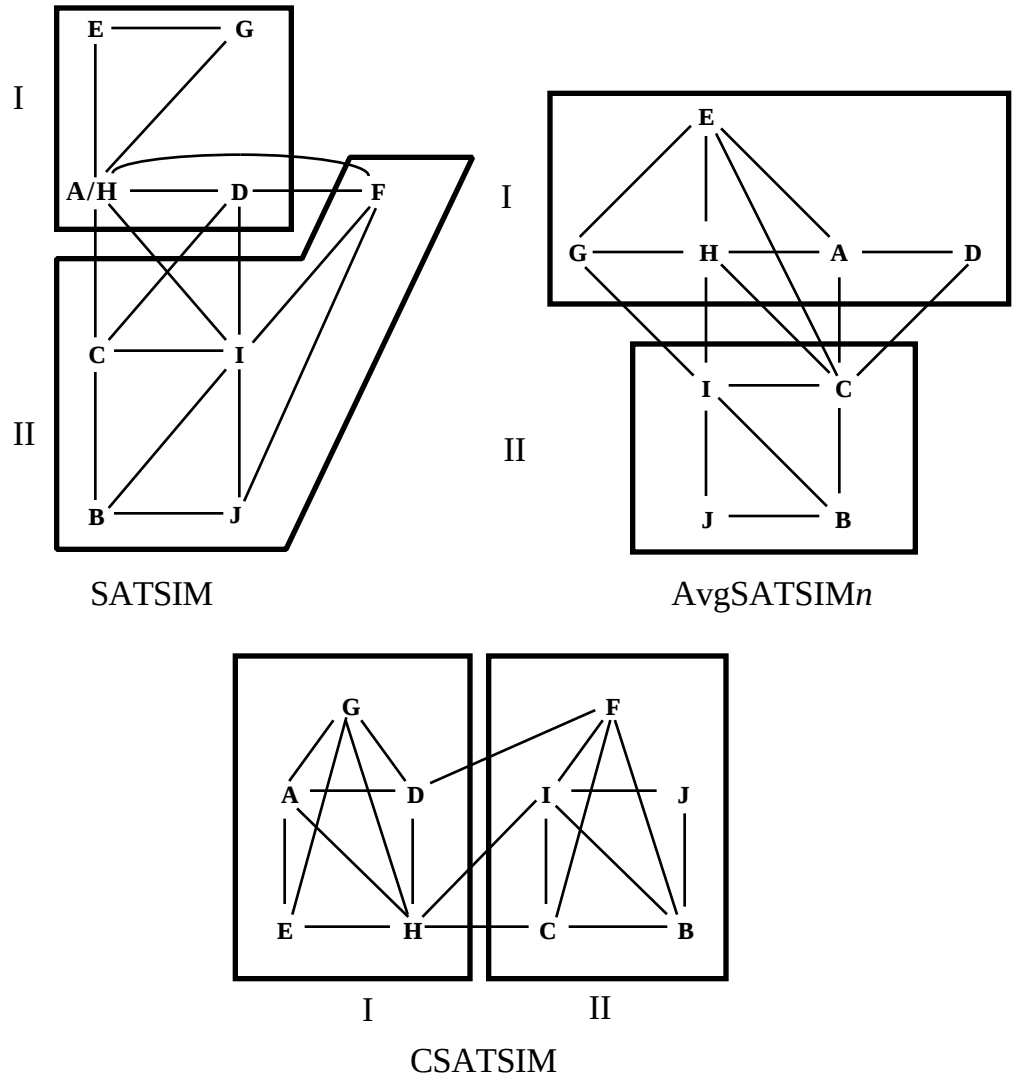

*Figure 3.68 A comparison of the CSATSIM families to SATSIM2 and AvgSATSIM*n *relations.*

The cseg of the pitch realization of **H** is: <0,6,4,5,3,2,4,1>.
The cseg of the pitch realization of **I** is: <0,4,2,5,3,1,6,5>.

COM-matrix of cseg **H**

	0	6	4	5	3	2	4	1
0	0	+	+	+	+	+	+	+
6	-	0	-	-	-	-	-	-
4	-	+	0	+	-	-	0	-
5	-	+	-	0	-	-	-	-
3	-	+	+	+	0	-	+	-
2	-	+	+	+	+	0	+	-
4	-	+	0	+	-	-	0	-
1	-	+	+	+	+	+	+	0

COM-matrix of cseg **I**

	0	4	2	5	3	1	6	5
0	0	+	+	+	+	+	+	+
4	-	0	-	+	-	-	+	+
2	-	+	0	+	+	-	+	+
5	-	-	-	0	-	-	+	0
3	-	+	-	+	0	-	+	+
1	-	+	+	+	+	0	+	+
6	-	-	-	-	-	-	0	-
5	-	-	-	0	-	-	+	0

CSIM is calculated by dividing the number of positions in the respective upper right triangles which have the same cint by the total number of positions in each upper right triangle.

$$\text{CSIM}(\mathbf{H}, \mathbf{I}) = \frac{17}{28} = 0.607$$

The diagonal just to the right of the "zero diagonal" provides the cints between adjacent members of the cseg. The pattern is identical (<+, -, +, -, -, +, ->) for csegs **H** and **I**.

*Figure 3.69 Contour segments (csegs), comparison (COM) matrices, and contour similarity (CSIM) for the pitch realizations of pcsets **H** and **I**.*

Figure 5.6 Four pcsets that realize SC 8-28 (the octatonic collection). Reprinted from Morris 1995 (225).

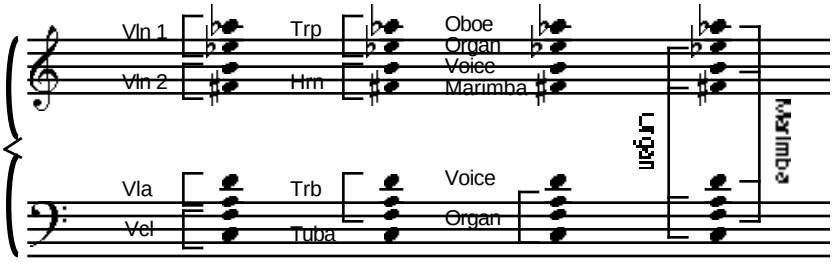

Figure 5.7 Four orchestrations of the third pset in figure 5.6 above.

Appendix A. Min(#*Y*, *X*) and max(#*Y*, *X*) values for all cardinalities of supersets (#*Y*) and all possible subset classes (*X*) where #*X* < #*Y* (when #*X* = #*Y*, min(#*Y*, *X*) = 0 and max(#*Y*, *X*) = 1, except for #0, #1, #11 and #12 SCs.)

#*Y*	SC *X*	Forte#(*X*)	min(#*Y*,*X*)	max(#*Y*,*X*)
